Multiple Image Correlator

STATINTL

Eastgate 2-6600

STATINTL

has completed work on this contract. They are awaiting shipping instructions and it will take them a few weeks to ready the machine for shipment. Their reports have some striking examples of the validity of the concept.

STATINTL

It seems to me this is a classic example of a wonderful solution looking for the right problem. Ken was in and apparently was much impressed with the potential. The machine made readable and unreadable photo of text material. Ken said however he had no money to exploit the acquisition end of the system. This was quite discouraging to I would think that any movie camera would generate material suitable for the correlator to work on.

gave a full day presentation to acquisition for an airborne camera for correlator material. They also left a proposal with them

STATINTL

Present work load and commitments will not permit to send their Electronics Correlator man back to WDC for a full month. They could perhaps send him back for one week and this could be repeated each month for several months until the machine had been thoroughly demonstrated.

If they are going to build a MK II or a Mk III, they would very much like to have the Mk I in their shop as a test bed for the follow on concepts.
